

MALLETA | AFRICAN

The “Malleta” is a semi-wired combination rope, designed to fulfil a specific function of the bottom trawl fishing. It is located between the trawl doors and the footrope, usually in the sweeps, and sometimes also in the lower bridles.

The **African Malleta África** is normally manufactured with water-absorbing covering materials, which increases the density of the rope. It is specially indicated to be used when we need the Malleta to be in continuous contact with the sea bed. on fairly non-abrasive sea beds. Its ductility makes this combination rope extremely adaptable to irregular sea beds.

CHARACTERISTICS

- **Steel material:** galvanized steel
- **Cover material:** Nylon
- **Construction:** 4 strands

- Good abrasion resistance
- Low elongation
- Good flexibility
